## Method for the Preparation of Citalopram

The present invention relates to a method for the preparation of the well-known antidepressant drug citalopram, 1-[3-(dimethylamino)propyl]-1-(4-fluorophenyl)-1,3-dihydro-5-isobenzofuran-carbonitrile.

## Background of the Invention

Citalopram is a well-known antidepressant drug that has now been on the market for some years and has the following structure:

It is a selective, centrally acting serotonin (5-hydroxytryptamine; 5-HT) reuptake inhibitor, accordingly having antidepressant activities. The antidepressant activity of the compound has been reported in several publications, eg. J. Hyttel *Prog. Neuro-Psychopharmacol. & Biol. Psychiat.* **1982**, *6*, 277-295 and A. Gravem *Acta Psychiatr. Scand.* **1987**, *75*, 478-486. The compound has further been disclosed to show effects in the treatment of dementia and cerebrovascular disorders, EP-A-474580.

Citalopram was first disclosed in DE 2,657,013, corresponding to US 4,136,193. This patent publication describes the preparation of citalopram by one method and outlines a further method which may be used for preparing citalopram.

According to the process described, the corresponding 1-(4-fluorophenyl)-1,3-dihydro-5-isobenzofurancarbonitrile is reacted with 3-(N,N-dimethylamino)propyl-chloride in the presence of methylsulfinylmethide as condensing agent. The starting material was prepared from the corresponding 5-bromo derivative by reaction with cuprous cyanide.

International patent application No. WO 98/019511 discloses a process for the manufacture of citalopram wherein a (4-(cyano, alkyloxycarbonyl or alkylaminocarbonyl)-2-hydroxymethylphenyl-(4-fluorophenyl)methanol compound is subjected to ring closure. The resulting 5-( alkyloxycarbonyl or alkylaminocarbonyl)-1-(4-fluorophenyl)-1,3-dihydroisobenzofuran is converted to the corres-

ponding 5-cyano derivative and the 5-cyano derivative is then alkylated with a (3-dimethylamino)propylhalogenide in order to obtain citalopram.

It has now, surprisingly, been found that citalopram may be manufactured by a novel favourable process where 5-cyano-1-(4-fluorophenyl)-1,3-dihydroisobenzofuran is alkylated with a compound which may be converted to a dimethylaminopropyl group.

The alkylation process according to the invention is particularly advantageous because the formation of by-products by polymerisation of the alkylating agent is avoided whereby a reduction in the amount of alkylating reagent used is made possible. In addition, the process of the invention provides high yields.

The reductive amination is carried out using conventional procedures for carrying out such reactions.
- 10 The compound of formula (VIIa) or (VIIb) may suitably be converted to the corresponding aldehyde by treatment with an organic or mineral acid or with resins carrying H<sup>+</sup> groups such as Dowex H<sup>+</sup> or Amberlyst.

- The resulting aldehyde may be converted to citalopram by reductive amination, i.e. by reaction with dimethylamine in the presence of a reducing agent such as NaBH<sub>4</sub> or NaBH<sub>3</sub>CN. Dimethylamine may be added to the reaction in the form of the dimethylammonium chloride salt.
- 15

- The ester derivative of formula (VIII) may be converted to citalopram via the corresponding alcohol of formula (IV) by reduction of the ester using Red-Al as a reducing agent or via the corresponding amide of formula (V) by reaction of the ester with NH(Me)<sub>2</sub> or a metal salt thereof.
- 20

Suitable, the agent useful for conversion of a compound of formula (IX) to a compound of formula (VI) is NaOH/Br<sub>2</sub>.

Alternatively, the compound of formula (X) may be treated with oxidation agents such as NaIO<sub>4</sub>, OsO<sub>4</sub>/NaIO<sub>4</sub> and KMnO<sub>4</sub>.
- 25

- The reductive amination of a compound of formula (XI) may suitably be carried out by reaction with dimethylamin in presence of a reducing agent such as NaBH<sub>4</sub> or NaBH<sub>3</sub>CN. Dimethylamine may be added to the reaction in the form of dimethylammonium chloride.
- 30

- The amino group in the compounds of formula (XII) and (XIV) may be methylated with methylating agents such as MeI and Me<sub>2</sub>SO<sub>4</sub>, wherein Me is methyl. The methylation is carried out using conventional procedures for carrying out such reactions.
- 35

According to this procedure, the compound of formula (XII) or (XIV) is reacted with compounds such as formaldehyde, paraformaldehyde or trioxan in presence of a reducing agent such as  $\text{NaBH}_4$  or  $\text{NaBH}_3\text{CN}$ . The reductive amination is carried out using

5 conventional procedures for carrying out such reactions.

The reaction conditions, solvents, etc. used for the reactions described above are conventional conditions for such reactions and may easily be determined by a person skilled in the art.

10 The starting material of formula (I) may be prepared as described in US patent No. 4,136,193 or as described in WO 98/019511.
